# Chapter 1. Introduction

SystemTap provides free software (GPL) infrastructure to simplify the gathering of information about the running Linux system. This assists diagnosis of a performance or functional problem. SystemTap eliminates the need for the developer to go through the tedious and disruptive instrument, recompile, install, and reboot sequence that may be otherwise required to collect data.

SystemTap provides a simple command line interface and scripting language for writing instrumentation for a live running kernel. The instrumentation makes extensive use of the probe points and functions provided in the *tapset* library. This document describes the various probe points and functions.

## Tapset Name Format

In this guide, tapset definitions appear in the following format:

```
name: return (parameters)
definition
```

The *return* field specifies what data type the tapset extracts and returns from the kernel during a probe (and thus, returns). Tapsets use 2 data types for *return*: *long* (tapset extracts and returns an integer) and *string* (tapset extracts and returns a string).

In some cases, tapsets do not have a *return* value. This simply means that the tapset does not extract anything from the kernel. This is common among asynchronous events such as timers, exit functions, and print functions.

---

# Chapter 2. Context Functions

The context functions provide additional information about the where the event occurred. These functions can provide information such as a backtrace where the event occurred and the current register values for the processor.

## Name

`print_regs` — Print a register dump.

## Synopsis

```
print_regs()
```

## Arguments

None

## Name

execname — Execname of current processes

## Synopsis

```
execname:string()
```

## Arguments

None

## Description

Return the name of the current process.

## Name

pid — Process ID of current process

## Synopsis

```
pid:long()
```

## Arguments

None

## Description

Return the id of the current process.

## Name

tid — Thread ID of current process

## Synopsis

```
tid:long()
```

## Arguments

None

## Description

Return the id of the current thread.

## Name

ppid — Parent Process ID of current process

## Synopsis

```
ppid:long()
```

## Arguments

None

## Description

Return the id of the parent process.

## Name

pexecname — Execname of the parent process.

## Synopsis

```
pexecname:string()
```

## Arguments

None

## Description

Return the name of the parent process.

## Name

gid — Group ID of current process

## Synopsis

```
gid:long()
```

## Arguments

None

## Description

Return the gid of the current process.

## Name

`egid` — Effective gid of the current process.

## Synopsis

```
egid:long()
```

## Arguments

None

## Description

Return the effective gid of the current process.

## Name

uid — User ID of the current process.

## Synopsis

```
uid:long()
```

## Arguments

None

## Description

Return the uid of the current process.

## Name

eid — Effective User ID of the current process.

## Synopsis

```
eid:long()
```

## Arguments

None

## Description

Return the effective uid of the current process.

## Name

cpu — The current cpu number.

## Synopsis

```
cpu:long()
```

## Arguments

None

## Description

Return the current cpu number.

## Name

pp — Current probe point

## Synopsis

```
pp:string()
```

## Arguments

None

## Description

Return the probe point associated with the currently running probe handler, including alias and wildcard expansion effects.

## Name

registers\_valid — Register information valid

## Synopsis

```
registers_valid:long()
```

## Arguments

None

## Description

Return 1 if `register` and `u_register` can be used in the current context, or 0 otherwise. For example, `<command>registers_valid</command>` returns 0 when called from a begin or end probe.

## Name

user\_mode — User Mode

## Synopsis

```
user_mode:long()
```

## Arguments

None

## Description

Return 1 if the probe point occurred in user-mode.

## Name

is\_return — Is return probe

## Synopsis

```
is_return:long()
```

## Arguments

None

## Description

Return 1 if the probe point is a return probe. *Deprecated.*

## Name

target — Target pid

## Synopsis

```
target:long()
```

## Arguments

None

## Description

Return the pid of the target process.

## Name

`stack_size` — Size of kernel stack

## Synopsis

```
stack_size:long()
```

## Arguments

None

## Description

Return the size of the kernel stack.

## Name

`stack_used` — Current amount of kernel stack used

## Synopsis

```
stack_used:long()
```

## Arguments

None

## Description

Return how many bytes are currently used in the kernel stack.

## Name

`stack_unused` — Amount of kernel stack currently available

## Synopsis

```
stack_unused:long()
```

## Arguments

None

## Description

Return how many bytes are currently available in the kernel stack.

## Name

`print_stack` — Print out stack from string

## Synopsis

```
print_stack(tk:string)
```

## Arguments

*tk* -- undescribed --

## Description

Perform a symbolic lookup of the addresses in the given `string`, which is assumed to be the result of a prior call to `backtrace`. Print one line per address, including the address, the name of the function containing the address, and an estimate of its position within that function. Return nothing.

## Name

probefunc — Function probed

## Synopsis

```
probefunc:string()
```

## Arguments

None

## Description

Return the probe point's function name, if known.

## Name

probemod — Module probed

## Synopsis

```
probemod:string()
```

## Arguments

None

## Description

Return the probe point's module name, if known.

## Name

`print_backtrace` — Print stack back trace

## Synopsis

```
print_backtrace()
```

## Arguments

None

## Description

Equivalent to `<command>print_stack(backtrace)</command>`, except that deeper stack nesting may be supported. Return nothing.

## Name

backtrace — Hex backtrace of current stack

## Synopsis

```
backtrace:string()
```

## Arguments

None

## Description

Return a string of hex addresses that are a backtrace of the stack. It may be truncated due to maximum string length.

## Name

caller — Return name and address of calling function

## Synopsis

```
caller:string()
```

## Arguments

None

## Description

Return the address and name of the calling function. <emphasis>Works only for return probes at this time.</emphasis>

## Name

caller\_addr — Return caller address

## Synopsis

```
caller_addr:long()
```

## Arguments

None

## Description

Return the address of the calling function. *Works only for return probes at this time.*

---

# Chapter 3. Timestamp Functions

Each timestamp function returns a value to indicate when the function is executed. Thus, these returned values can be used to indicate when an event occurs, provide an ordering for events, or compute the amount of time elapsed between time stamps.

## Name

`get_cycles` — Processor cycle count.

## Synopsis

```
get_cycles:long()
```

## Arguments

None

## Description

Return the processor cycle counter value, or 0 if unavailable.

## Name

`gettimeofday_ns` — Number of nanoseconds since UNIX epoch.

## Synopsis

```
gettimeofday_ns:long()
```

## Arguments

None

## Description

Return the number of nanoseconds since the UNIX epoch.

## Name

`gettimeofday_us` — Number of microseconds since UNIX epoch.

## Synopsis

```
gettimeofday_us:long()
```

## Arguments

None

## Description

Return the number of microseconds since the UNIX epoch.

## Name

`gettimeofday_ms` — Number of milliseconds since UNIX epoch.

## Synopsis

```
gettimeofday_ms:long()
```

## Arguments

None

## Description

Return the number of milliseconds since the UNIX epoch.

## Name

`gettimeofday_s` — Number of seconds since UNIX epoch.

## Synopsis

```
gettimeofday_s:long()
```

## Arguments

None

## Description

Return the number of seconds since the UNIX epoch.

---

## Chapter 4. Memory Tapset

## Name

`vm_fault_contains` — Test return value for page fault reason

## Synopsis

```
vm_fault_contains:long (value:long, test:long)
```

## Arguments

<i>value</i>	The <code>fault_type</code> returned by <code>vm.page_fault.return</code>
<i>test</i>	The type of fault to test for ( <code>VM_FAULT_OOM</code> or similar)

## Name

probe vm.pagefault — Records that a page fault occurred.

## Synopsis

```
probe vm.pagefault
```

## Values

*write\_access* Indicates whether this was a write or read access; `<command>1</command>` indicates a write, while `<command>0</command>` indicates a read.

*address* The address of the faulting memory access; i.e. the address that caused the page fault.

## Context

The process which triggered the fault

## Name

probe vm.pagefault.return — Indicates what type of fault occurred.

## Synopsis

```
probe vm.pagefault.return
```

## Values

*fault\_type* Returns either `<command>0</command>` (VM\_FAULT\_OOM) for out of memory faults, `<command>2</command>` (VM\_FAULT\_MINOR) for minor faults, `<command>3</command>` (VM\_FAULT\_MAJOR) for major faults, or `<command>1</command>` (VM\_FAULT\_SIGBUS) if the fault was neither OOM, minor fault, nor major fault.

## Name

`addr_to_node` — Returns which node a given address belongs to within a NUMA system.

## Synopsis

```
addr_to_node:long(addr:long)
```

## Arguments

*addr*    The address of the faulting memory access.

## Name

probe vm.write\_shared — Attempts at writing to a shared page.

## Synopsis

```
probe vm.write_shared
```

## Values

<i>address</i>	The address of the shared write.
----------------	----------------------------------

## Context

The context is the process attempting the write.

## Description

Fires when a process attempts to write to a shared page. If a copy is necessary, this will be followed by a `<command>vm.write_shared_copy</command>`.

## Name

probe vm.write\_shared\_copy — Page copy for shared page write.

## Synopsis

```
probe vm.write_shared_copy
```

## Values

*zero* Boolean indicating whether it is a zero page (can do a clear instead of a copy).

*address* The address of the shared write.

## Context

The process attempting the write.

## Description

Fires when a write to a shared page requires a page copy. This is always preceded by a `<command>vm.shared_write</command>`.

## Name

probe vm.mmap — Fires when an `<command>mmap</command>` is requested.

## Synopsis

```
probe vm.mmap
```

## Values

<i>length</i>	The length of the memory segment
---------------	----------------------------------

<i>address</i>	The requested address
----------------	-----------------------

## Context

The process calling `<command>mmap</command>`.

## Name

probe vm.munmap — Fires when an `<command>munmap</command>` is requested.

## Synopsis

```
probe vm.munmap
```

## Values

<i>length</i>	The length of the memory segment
---------------	----------------------------------

<i>address</i>	The requested address
----------------	-----------------------

## Context

The process calling `<command>munmap</command>`.

## Name

probe vm.brk — Fires when a <command>brk</command> is requested (i.e. the heap will be resized).

## Synopsis

```
probe vm.brk
```

## Values

<i>length</i>	The length of the memory segment
---------------	----------------------------------

<i>address</i>	The requested address
----------------	-----------------------

## Context

The process calling <command>brk</command>.

## Name

probe vm.oom\_kill — Fires when a thread is selected for termination by the OOM killer.

## Synopsis

```
probe vm.oom_kill
```

## Values

*task*    The task being killed

## Context

The process that tried to consume excessive memory, and thus triggered the OOM. <remark>(is this correct?)</remark>

---

# Chapter 5. IO Scheduler Tapset

This family of probe points is used to probe the IO scheduler activities. It contains the following probe points:

## Name

probe ioscheduler.elv\_next\_request — Retrieve request from request queue

## Synopsis

```
probe ioscheduler.elv_next_request
```

## Values

<i>elevator_name</i>	The elevator name
----------------------	-------------------

## Name

probe ioscheduler.elv\_next\_request.return — Return from retrieving a request

## Synopsis

```
probe ioscheduler.elv_next_request.return
```

## Values

<i>req_flags</i>	Request flags
<i>req</i>	Address of the request
<i>disk_major</i>	Disk major number of the request
<i>disk_minor</i>	Disk minor number of the request

## Name

probe ioscheduler.elv\_add\_request — Add a request into request queue

## Synopsis

```
probe ioscheduler.elv_add_request
```

## Values

<i>req_flags</i>	Request flags
<i>req</i>	Address of the request
<i>disk_major</i>	Disk major number of the request
<i>elevator_name</i>	The elevator name
<i>disk_minor</i>	Disk minor number of the request

## Name

probe ioscheduler.elv\_completed\_request — Request is completed

## Synopsis

```
probe ioscheduler.elv_completed_request
```

## Values

<i>req_flags</i>	Request flags
<i>req</i>	Address of the request
<i>disk_major</i>	Disk major number of the request
<i>elevator_name</i>	The elevator name
<i>disk_minor</i>	Disk minor number of the request

---

## Chapter 6. SCSI Tapset

This family of probe points is used to probe the SCSI activities. It contains the following probe points:

## Name

probe scsi.ioentry — Prepares a SCSI mid-layer request

## Synopsis

```
probe scsi.ioentry
```

## Values

<i>disk_major</i>	The major number of the disk (-1 if no information)
<i>device_state</i>	The current state of the device.
<i>disk_minor</i>	The minor number of the disk (-1 if no information)

## Name

probe scsi.iodyspatching — SCSI mid-layer dispatched low-level SCSI command

## Synopsis

probe scsi.iodyspatching

## Values

<i>lun</i>	The lun number
<i>req_bufflen</i>	The request buffer length
<i>host_no</i>	The host number
<i>device_state</i>	The current state of the device.
<i>dev_id</i>	The scsi device id
<i>channel</i>	The channel number
<i>data_direction</i>	The data_direction specifies whether this command is from/to the device. 0 (DMA_BIDIRECTIONAL), 1 (DMA_TO_DEVICE), 2 (DMA_FROM_DEVICE), 3 (DMA_NONE)
<i>request_buffer</i>	The request buffer address

## Name

probe scsi.iode — SCSI command completed by low level driver and enqueued into the done queue.

## Synopsis

```
probe scsi.iode
```

## Values

<i>lun</i>	The lun number
<i>host_no</i>	The host number
<i>device_state</i>	The current state of the device
<i>dev_id</i>	The scsi device id
<i>channel</i>	The channel number
<i>data_direction</i>	The data_direction specifies whether this command is from/to the device.

## Name

probe scsi.iocompleted — SCSI mid-layer running the completion processing for block device I/O requests

## Synopsis

```
probe scsi.iocompleted
```

## Values

<i>lun</i>	The lun number
<i>host_no</i>	The host number
<i>device_state</i>	The current state of the device
<i>dev_id</i>	The scsi device id
<i>channel</i>	The channel number
<i>data_direction</i> device	The data_direction specifies whether this command is from/to the
<i>goodbytes</i>	The bytes completed.

---

# Chapter 7. Networking Tapset

This family of probe points is used to probe the activities of network device.

## Name

probe netdev.receive — Data recieved from network device.

## Synopsis

```
probe netdev.receive
```

## Values

<i>protocol</i>	Protocol of recieved packet.
<i>dev_name</i>	The name of the device. e.g: eth0, ath1.
<i>length</i>	The length of the receiving buffer.

## Name

probe netdev.transmit — Network device transmitting buffer

## Synopsis

```
probe netdev.transmit
```

## Values

<i>protocol</i>	The protocol of this packet.
<i>dev_name</i>	The name of the device. e.g: eth0, ath1.
<i>length</i>	The length of the transmit buffer.
<i>true_size</i>	The size of the the data to be transmitted.

---

## Chapter 8. Socket Tapset

This family of probe points is used to probe socket activities. It contains the following probe points:

## Name

probe socket.send — Message sent on a socket.

## Synopsis

```
probe socket.send
```

## Values

<i>success</i>	Was send successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Size of message sent (in bytes) or error code if success = 0
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message sender

## Name

probe socket.receive — Message received on a socket.

## Synopsis

```
probe socket.receive
```

## Values

<i>success</i>	Was send successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Size of message received (in bytes) or error code if success = 0
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message receiver

## Name

probe socket.sendmsg.return — Return from Message being sent on socket

## Synopsis

```
probe socket.sendmsg.return
```

## Values

<i>success</i>	Was send successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Size of message sent (in bytes) or error code if success = 0
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message sender.

## Description

Fires at the conclusion of sending a message on a socket via the `sock_sendmsg` function

## Name

probe socket.recvmsg — Message being received on socket

## Synopsis

```
probe socket.recvmsg
```

## Values

<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Message size in bytes
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message receiver.

## Description

Fires at the beginning of receiving a message on a socket via the `sock_recvmsg` function

## Name

probe socket.aio\_write — Message send via sock\_aio\_write

## Synopsis

```
probe socket.aio_write
```

## Values

<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Message size in bytes
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message sender

## Description

Fires at the beginning of sending a message on a socket via the `sock_aio_write` function

## Name

probe socket.aio\_write.return — Conclusion of message send via `sock_aio_write`

## Synopsis

```
probe socket.aio_write.return
```

## Values

<i>success</i>	Was receive successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Size of message received (in bytes) or error code if success = 0
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message receiver.

## Description

Fires at the conclusion of sending a message on a socket via the `sock_aio_write` function

## Name

probe socket.aio\_read — Receiving message via `sock_aio_read`

## Synopsis

```
probe socket.aio_read
```

## Values

<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Message size in bytes
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message sender

## Description

Fires at the beginning of receiving a message on a socket via the `sock_aio_read` function

## Name

probe socket.aio\_read.return — Conclusion of message received via `sock_aio_read`

## Synopsis

```
probe socket.aio_read.return
```

## Values

<i>success</i>	Was receive successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Size of message received (in bytes) or error code if success = 0
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message receiver.

## Description

Fires at the conclusion of receiving a message on a socket via the `sock_aio_read` function

## Name

probe socket.writev — Message sent via `socket_writev`

## Synopsis

`probe socket.writev`

## Values

<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Message size in bytes
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message sender

## Description

Fires at the beginning of sending a message on a socket via the `sock_writev` function

## Name

probe socket.writev.return — Conclusion of message sent via `socket_writev`

## Synopsis

probe socket.writev.return

## Values

<i>success</i>	Was send successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Size of message sent (in bytes) or error code if success = 0
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message receiver.

## Description

Fires at the conclusion of sending a message on a socket via the `sock_writev` function

## Name

probe socket.readv — Receiving a message via `sock_readv`

## Synopsis

```
probe socket.readv
```

## Values

<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Message size in bytes
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message sender

## Description

Fires at the beginning of receiving a message on a socket via the `sock_readv` function

## Name

probe socket.readv.return — Conclusion of receiving a message via `sock_readv`

## Synopsis

`probe socket.readv.return`

## Values

<i>success</i>	Was receive successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>size</i>	Size of message received (in bytes) or error code if success = 0
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The message receiver.

## Description

Fires at the conclusion of receiving a message on a socket via the `sock_readv` function

## Name

probe socket.create — Creation of a socket

## Synopsis

```
probe socket.create
```

## Values

<i>protocol</i>	Protocol value
<i>name</i>	Name of this probe
<i>requester</i>	Requested by user process or the kernel (1 = kernel, 0 = user)
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The requester (see requester variable)

## Description

Fires at the beginning of creating a socket.

## Name

probe socket.create.return — Return from Creation of a socket

## Synopsis

probe socket.create.return

## Values

<i>success</i>	Was socket creation successful? (1 = yes, 0 = no)
<i>protocol</i>	Protocol value
<i>err</i>	Error code if success == 0
<i>name</i>	Name of this probe
<i>requester</i>	Requested by user process or the kernel (1 = kernel, 0 = user)
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The requester (user process or kernel)

## Description

Fires at the conclusion of creating a socket.

## Name

probe socket.close — Close a socket

## Synopsis

```
probe socket.close
```

## Values

<i>protocol</i>	Protocol value
<i>flags</i>	Socket flags value
<i>name</i>	Name of this probe
<i>state</i>	Socket state value
<i>type</i>	Socket type value
<i>family</i>	Protocol family value

## Context

The requester (user process or kernel)

## Description

Fires at the beginning of closing a socket.

## Name

probe socket.close.return — Return from closing a socket

## Synopsis

```
probe socket.close.return
```

## Values

*name*     Name of this probe

## Context

The requester (user process or kernel)

## Description

Fires at the conclusion of closing a socket.

---

## Chapter 9. TCP Tapset

This family of probe points is used to probe TCP layer activities. It contains the following probe points:

## Name

probe tcp.sendmsg — Sending a tcp message

## Synopsis

probe tcp.sendmsg

## Values

<i>name</i>	Name of this probe
<i>size</i>	Number of bytes to send
<i>sock</i>	Network socket

## Context

The process which sends a tcp message

## Name

probe tcp.sendmsg.return — Sending TCP message is done

## Synopsis

```
probe tcp.sendmsg.return
```

## Values

<i>name</i>	Name of this probe
<i>size</i>	Number of bytes sent or error code if an error occurred.

## Context

The process which sends a tcp message

## Name

probe tcp.recvmsg — Receiving TCP message

## Synopsis

```
probe tcp.recvmsg
```

## Values

<i>name</i>	Name of this probe
<i>size</i>	Number of bytes to be received
<i>sock</i>	Network socket

## Context

The process which receives a tcp message

## Name

probe tcp.recvmsg.return — Receiving TCP message complete

## Synopsis

```
probe tcp.recvmsg.return
```

## Values

<i>name</i>	Name of this probe
<i>size</i>	Number of bytes received or error code if an error occurred.

## Context

The process which receives a tcp message

## Name

probe tcp.disconnect — TCP socket disconnection

## Synopsis

probe tcp.disconnect

## Values

<i>flags</i>	TCP flags (e.g. FIN, etc)
<i>name</i>	Name of this probe
<i>sock</i>	Network socket

## Context

The process which disconnects tcp

## Name

probe tcp.disconnect.return — TCP socket disconnection complete

## Synopsis

```
probe tcp.disconnect.return
```

## Values

*ret*      Error code (0: no error)

*name*     Name of this probe

## Context

The process which disconnects tcp

## Name

probe tcp.setsockopt — Call to `setsockopt`

## Synopsis

probe tcp.setsockopt

## Values

<i>optstr</i>	Resolves <code>optname</code> to a human-readable format
<i>level</i>	The level at which the socket options will be manipulated
<i>optlen</i>	Used to access values for <code>setsockopt</code>
<i>name</i>	Name of this probe
<i>optname</i>	TCP socket options (e.g. <code>TCP_NODELAY</code> , <code>TCP_MAXSEG</code> , etc)
<i>sock</i>	Network socket

## Context

The process which calls `setsockopt`

## Name

probe tcp.setsockopt.return — Return from setsockopt

## Synopsis

```
probe tcp.setsockopt.return
```

## Values

*ret*      Error code (0: no error)

*name*     Name of this probe

## Context

The process which calls setsockopt

---

# Chapter 10. UDP Tapset

This family of probe points is used to probe UDP layer activities. It contains the following probe points:

## Name

probe udp.sendmsg — Fires whenever a process sends a UDP message

## Synopsis

```
probe udp.sendmsg
```

## Values

<i>name</i>	Name of this probe
<i>size</i>	Number of bytes to send
<i>sock</i>	Network socket

## Context

The process which sends a udp message

## Name

probe udp.sendmsg.return — Fires whenever an attempt to send a UDP message is completed

## Synopsis

```
probe udp.sendmsg.return
```

## Values

<i>name</i>	Name of this probe
<i>size</i>	Number of bytes sent

## Context

The process which sends a udp message

## Name

probe udp.recvmsg — Fires whenever a UDP message is received

## Synopsis

```
probe udp.recvmsg
```

## Values

<i>name</i>	Name of this probe
<i>size</i>	Number of bytes received
<i>sock</i>	Network socket

## Context

The process which receives a udp message

## Name

probe udp.recvmsg.return — An attempt to receive a UDP message received has been completed

## Synopsis

```
probe udp.recvmsg.return
```

## Values

*name*     Name of this probe

*size*     Number of bytes received

## Context

The process which receives a udp message

## Name

probe udp.disconnect — A process requests for UDP to be UDP disconnected

## Synopsis

```
probe udp.disconnect
```

## Values

<i>flags</i>	Flags (e.g. FIN, etc)
<i>name</i>	Name of this probe
<i>sock</i>	Network socket

## Context

The process which disconnects UDP

## Name

probe udp.disconnect.return — UDP has been disconnected successfully

## Synopsis

```
probe udp.disconnect.return
```

## Values

*ret*      Error code (0: no error)

*name*     Name of this probe

## Context

The process which disconnects udp

---

# Chapter 11. Process Tapset

This family of probe points is used to probe the process activities. It contains the following probe points:

## Name

probe process.create — Fires whenever a new process is successfully created

## Synopsis

```
probe process.create
```

## Values

<i>new_pid</i>	The PID of the newly created process
----------------	--------------------------------------

## Context

Parent of the created process.

## Description

Fires whenever a new process is successfully created, either as a result of `<command>fork</command>` (or one of its syscall variants), or a new kernel thread.

## Name

probe process.start — Starting new process

## Synopsis

```
probe process.start
```

## Values

None

## Context

Newly created process.

## Description

Fires immediately before a new process begins execution.

## Name

probe process.exec — Attempt to exec to a new program

## Synopsis

```
probe process.exec
```

## Values

<i>filename</i>	The path to the new executable
-----------------	--------------------------------

## Context

The caller of exec.

## Description

Fires whenever a process attempts to exec to a new program.

## Name

probe process.exec\_complete — Return from exec to a new program

## Synopsis

```
probe process.exec_complete
```

## Values

*success*      A boolean indicating whether the exec was successful

*errno*        The error number resulting from the exec

## Context

On success, the context of the new executable. On failure, remains in the context of the caller.

## Description

Fires at the completion of an exec call.

## Name

probe process.exit — Exit from process

## Synopsis

```
probe process.exit
```

## Values

*code*     The exit code of the process

## Context

The process which is terminating.

## Description

Fires when a process terminates. This will always be followed by a process.release, though the latter may be delayed if the process waits in a zombie state.

## Name

probe process.release — Process released

## Synopsis

```
probe process.release
```

## Values

<i>pid</i>	PID of the process being released
<i>task</i>	A task handle to the process being released

## Context

The context of the parent, if it wanted notification of this process' termination, else the context of the process itself.

## Description

Fires when a process is released from the kernel. This always follows a process.exit, though it may be delayed somewhat if the process waits in a zombie state.

---

# Chapter 12. Signal Tapset

This family of probe points is used to probe signal activities. It contains the following probe points:

## Name

probe signal.send — Fires when a system call or kernel function sends a signal to a process.

## Synopsis

```
probe signal.send
```

## Values

<i>name</i>	The name of the function used to send out the signal
<i>task</i>	A task handle to the signal recipient
<i>sinfo</i>	The address of <command>siginfo</command> struct
<i>si_code</i>	Indicates the signal type
<i>sig_name</i>	A string representation of the signal
<i>sig</i>	The number of the signal
<i>shared</i>	Indicates whether the signal is shared by the thread group <i>send2queue</i> - Indicates whether the signal is sent to an existing <command>sigqueue</command>
<i>sig_pid</i>	The PID of the process receiving the signal
<i>pid_name</i>	The name of the signal recipient

## Context

The signal's sender.

## Name

probe signal.send.return — Fires when a signal sent to a process returns.

## Synopsis

probe signal.send.return

## Values

<i>retstr</i>	The return value to either <code>&lt;command&gt;__group_send_sig_info&lt;/command&gt;</code> , <code>&lt;command&gt;specific_send_sig_info&lt;/command&gt;</code> , or <code>&lt;command&gt;send_sigqueue&lt;/command&gt;</code> . Refer to the Description of this probe for more information about the return values of each function call.
<i>send2queue</i>	Indicates whether the sent signal was sent to an existing <code>&lt;command&gt;sigqueue&lt;/command&gt;</code>
<i>name</i>	The name of the function used to send out the signal.
<i>shared</i>	Indicates whether the sent signal is shared by the thread group.

## Context

The signal's sender. `<remark>(correct?)</remark>`

## Description

Possible `<command>__group_send_sig_info</command>` and `<command>specific_send_sig_info</command>` return values are as follows;

`<command>0</command>` - The signal is successfully sent to a process, which means that `<1>` the signal was ignored by the receiving process, `<2>` this is a non-RT signal and the system already has one queued, and `<3>` the signal was successfully added to the `<command>sigqueue</command>` of the receiving process.

`<command>-EAGAIN</command>` - The `<command>sigqueue</command>` of the receiving process is overflowing, the signal was RT, and the signal was sent by a user using something other than `<command>kill</command>`

Possible `<command>send_group_sigqueue</command>` and `<command>send_sigqueue</command>` return values are as follows;

`<command>0</command>` - The signal was either successfully added into the `<command>sigqueue</command>` of the receiving process, or a `<command>SI_TIMER</command>` entry is already queued (in which case, the overrun count will be simply incremented).

`<command>1</command>` - The signal was ignored by the receiving process.

`<command>-1</command>` - (`<command>send_sigqueue</command>` only) The task was marked `<command>exiting</command>`, allowing `* <command>posix_timer_event</command>` to redirect it to the group leader.

## Name

probe signal.checkperm — Fires when a permission check is performed on a sent signal

## Synopsis

probe signal.checkperm

## Values

<i>name</i>	Name of the probe point; default value is <command>signal.checkperm</command>
<i>task</i>	A task handle to the signal recipient
<i>sinfo</i>	The address of the <command>sinfo</command> structure
<i>si_code</i>	Indicates the signal type
<i>sig_name</i>	A string representation of the signal
<i>sig</i>	The number of the signal
<i>pid_name</i>	Name of the process receiving the signal
<i>sig_pid</i>	The PID of the process receiving the signal

## Name

probe signal.wakeup — Wakes up a sleeping process, making it ready for new active signals

## Synopsis

```
probe signal.wakeup
```

## Values

<i>resume</i>	Indicates whether to wake up a task in a <code>&lt;command&gt;STOPPED&lt;/command&gt;</code> or <code>&lt;command&gt;TRACED&lt;/command&gt;</code> state
<i>state_mask</i>	A string representation indicating the mask of task states you wish to wake. Possible values are <code>&lt;command&gt;TASK_INTERRUPTIBLE&lt;/command&gt;</code> , <code>&lt;command&gt;TASK_STOPPED&lt;/command&gt;</code> , <code>&lt;command&gt;TASK_TRACED&lt;/command&gt;</code> , and <code>&lt;command&gt;TASK_INTERRUPTIBLE&lt;/command&gt;</code> .
<i>pid_name</i>	Name of the process you wish to wake
<i>sig_pid</i>	The PID of the process you wish to wake

## Name

probe signal.check\_ignored — Fires when a system call or kernel function checks whether a

## Synopsis

probe signal.check\_ignored

## Values

<i>sig_name</i>	A string representation of the signal
<i>sig</i>	The number of the signal
<i>pid_name</i>	Name of the process receiving the signal
<i>sig_pid</i>	The PID of the process receiving the signal

## Description

signal was ignored or not

## Name

probe signal.force\_segv — Fires when a system call, kernel function, or process sent a

## Synopsis

probe signal.force\_segv

## Values

<i>sig_name</i>	A string representation of the signal
<i>sig</i>	The number of the signal
<i>pid_name</i>	Name of the process receiving the signal
<i>sig_pid</i>	The PID of the process receiving the signal

## Description

<command>SIGSEGV</command> as a result of problems it encountered while handling a received signal

## Name

probe signal.syskill — Fires when the kernel function `<command>sys_kill</command>`

## Synopsis

```
probe signal.syskill
```

## Values

*sig* The specific signal sent to the process

*pid* The PID of the process receiving the kill signal

## Description

sends a kill signal to a process

## Name

probe signal.sys\_tkill — Fires when <command>tkill</command> sends a kill signal

## Synopsis

```
probe signal.sys_tkill
```

## Values

*sig* The specific signal sent to the process The <command>tkill</command> call is analogous to <command>kill(2)</command>, except that it also allows a process within a specific thread group to be targetted. Such processes are targetted through their unique thread IDs (TID).

*pid* The PID of the process receiving the kill signal

## Description

to a process that is part of a thread group

## Name

probe signal.sys\_tgkill — Fires when the kernel function `<command>tgkill</command>`

## Synopsis

```
probe signal.sys_tgkill
```

## Values

*sig*      The specific kill signal sent to the process The `<command>tgkill</command>` call is similar to `<command>tkill</command>`, except that it also allows the caller to specify the thread group ID of the thread to be signalled. This protects against TID reuse.

*pid*      The PID of the thread receiving the kill signal

*tgid*      The thread group ID of the thread receiving the kill signal

## Description

sends a kill signal to a specific thread group

## Name

probe signal.send\_sig\_queue — Fires when a signal is queued to a process

## Synopsis

```
probe signal.send_sig_queue
```

## Values

<i>sigqueue_addr</i>	The address of the signal queue
<i>sig_name</i>	A string representation of the signal
<i>sig</i>	The queued signal
<i>pid_name</i>	Name of the process to which the signal is queued
<i>sig_pid</i>	The PID of the process to which the signal is queued

## Name

probe signal.pending — Fires when the `<command>SIGPENDING</command>` system call is used;

## Synopsis

```
probe signal.pending
```

## Values

<i>sigset_size</i>	The size of the user-space signal set.
<i>sigset_add</i>	The address of the user-space signal set ( <code>&lt;command&gt;sigset_t&lt;/command&gt;</code> )

## Description

this normally occurs when the `<command>do_sigpending</command>` kernel function is executed

## Synopsis

```
<programlisting>long do_sigpending(void __user *set, unsigned long sigsetsize)</programlisting>
```

This probe is used to examine a set of signals pending for delivery to a specific thread.

## Name

probe signal.handle — Fires when the signal handler is invoked

## Synopsis

```
probe signal.handle
```

## Values

<i>regs</i>	The address of the kernel-mode stack area
<i>sig_code</i>	The <code>&lt;command&gt;si_code&lt;/command&gt;</code> value of the <code>&lt;command&gt;siginfo&lt;/command&gt;</code> signal
<i>sig_mode</i>	Indicates whether the signal was a user-mode or kernel-mode signal
<i>sinfo</i>	The address of the <code>&lt;command&gt;siginfo&lt;/command&gt;</code> table
<i>oldset_addr</i>	The address of the bitmask array of blocked signals
<i>sig</i>	The signal number that invoked the signal handler
<i>ka_addr</i>	The address of the <code>&lt;command&gt;k_sigaction&lt;/command&gt;</code> table associated with the signal

## Synopsis

```
<programlisting>static int handle_signal(unsigned long sig, siginfo_t *info, struct k_sigaction *ka, sigset_t *oldset, struct pt_regs *regs)</programlisting>
```

## Name

probe signal.do\_action — Initiates a trace when a thread is about to examine

## Synopsis

```
probe signal.do_action
```

## Values

<i>sa_mask</i>	The new mask of the signal
<i>oldsigact_addr</i>	The address of the old <command>sigaction</command> struct associated with the signal
<i>sig</i>	The signal to be examined/changed
<i>sa_handler</i>	The new handler of the signal
<i>sigact_addr</i>	The address of the new <command>sigaction</command> struct associated with the signal

## Description

and change a signal action

## Name

probe signal.procmask — Initiates a trace when a thread is about to examine and change blocked signals

## Synopsis

probe signal.procmask

## Values

<i>how</i>	Indicates how to change the blocked signals; possible values are <code>&lt;command&gt;SIG_BLOCK=0&lt;/command&gt;</code> (for blocking signals), <code>&lt;command&gt;SIG_UNBLOCK=1&lt;/command&gt;</code> (for unblocking signals), and <code>&lt;command&gt;SIG_SETMASK=2&lt;/command&gt;</code> for setting the signal mask.
<i>oldsigset_addr</i>	The old address of the signal set ( <code>&lt;command&gt;sigset_t&lt;/command&gt;</code> )
<i>sigset</i>	The actual value to be set for <code>&lt;command&gt;sigset_t&lt;/command&gt;</code> <remark>(correct?)</remark>
<i>sigset_addr</i>	The address of the signal set ( <code>&lt;command&gt;sigset_t&lt;/command&gt;</code> ) to be implemented

## Synopsis

<programlisting>int sigprocmask(int how, sigset\_t \*set, sigset\_t \*oldset)</programlisting>

## Name

probe signal.flush — Fires when all pending signals for a task are flushed

## Synopsis

```
probe signal.flush
```

## Values

<i>task</i>	The task handler of the process performing the flush
<i>pid_name</i>	The name of the process associated with the task performing the flush
<i>sig_pid</i>	The PID of the process associated with the task performing the flush

## Synopsis

```
<programlisting>void flush_signals(struct task_struct *t)</programlisting>
```
